STATINTL

Dear Earl:

Please find enclosed a print of the overall dimensions of the HTA-5 processor complete with the service unit.

The distance between the processor itself and the service unit has been established as four feet, and the duct work from the air bearing blower to the processor has been based on this dimension.

The distance between the service unit and the hold and mix station is established as two feet but this could be varied as required, if necessary to the point where the two units are in contact.

I trust this print will answer the questions you have on overall sizes of the machine.

Please do not hesitate to contact me for further information.

Yours truly,

IGR/ew
encls.
